

How digitalization acts as a driver of decarbonization

“Digitalization can provide a much better, more transparent picture of the state of the world, nature, and the environment. However, the application of new technologies does not automatically result in a positive effect on the environmental balance. That's why we need to design digitalization in such a way that it can contribute to achieving our climate-neutral goals. At the same time, we must reduce the consumption of energy and resources from fossil fuels in order to achieve environmentally compatible digitalization. The corona crisis is acting as an accelerator of digitalization, which can help us to see the current crisis as an opportunity for more climate neutrality.”
